

gRPC adapter — the threads a connection and then one RPC cross

How to read this figure

QP	one full-duplex DPUMesh byte stream, one per connection	forward / reverse ring	host→DPU descriptor queue / DPU→host completion queue
EQ	event queue one reactor thread polls for its QPs	DPA EU	BlueField accelerator core that drains forward rings
EQ owner thread	the adapter's reactor shard: one thread per EQ	SG-DMA	scatter-gather DMA into the receiver's registered memory
