

DPUmesh control plane — implemented authority and runtime placement

Kubernetes states identity; the host proves process ownership; the DPU verifies and enforces.

How to read this figure

assertion	Pod/container/slot/nonce binding the DPU cannot observe
slot	one Device Plugin resource and one Unix socket
broker	one isolated host child owning DOCA objects

feed	complete signed document installed atomically
node mTLS	URI SAN spiffe://dpumesh.io/node/<name>
fail-closed	invalid or unavailable authority admits no new slot
